Summary

Backend developer and data engineer with 3+ years building Node.js services and data pipelines in Python and SQL. Built a notification service handling 10,000+ messages a month and migrated an on-premises order database to Microsoft Fabric.

Skills

Languages: JavaScript, TypeScript, Python, SQL
Backend & APIs: Node.js, Express, Flask, REST APIs
Data & Cloud: SQL Server, Microsoft Fabric, Azure, Firebase, stored procedures, Python notebooks
Frontend: React, HTML/CSS, vanilla JS and DOM APIs, Three.js
Tools & AI: Git, CI/CD, Claude Code, Cowork

Experience

Backend Developer **Feb 2023 – Present**
Toromont Cat · Concord, ON

- Built a customer-facing notification service in Node.js and Twilio delivering thousands of order-status emails and SMS per month, peaking above 10,000, across the full parts-order lifecycle
- Replaced manual status phone calls from branch staff with automated updates, removing a recurring support task and giving customers order status without having to call in
- Instrumented the service with structured logging and error handling that persists every Twilio API response and delivery failure to SQL Server, giving staff a queryable record for delivery disputes
- Migrated the on-premises parts and order database to Microsoft Fabric using Copy Jobs and stored procedures, spanning tables from a few records to several million rows
- Cut a core table build from 15 minutes to 5 by rewriting full-reload stored procedures as incremental MERGE upserts, and exposed curated datasets through Materialized Lake Views
- Developed Python notebooks in Fabric that build the tables behind the company's data catalog report, used across the business to find where datasets live in Fabric

Frontend Engineer **Apr 2022 – Jun 2022**
Chelsea Avondale · Kitchener, ON
Customer-facing website build for an early-stage insurance carrier

- Built an interactive property-mapping tool with the Google Maps JavaScript API that let users draw shapes directly on a map and capture their exact coordinates, with configurable shape types and styling
- Developed a searchable FAQ system over a JSON content model of nested questions, including a recursive algorithm that traverses the question tree in both directions to generate breadcrumbs
- Built a drag-and-drop document upload page in vanilla JavaScript and CSS with a live file queue and batch submission
- Wrote and deployed the Python and Flask endpoints backing these pages, serving content to the front end and handling form and file submissions

Web Developer (part-time) **May 2019 – Apr 2022**
Toronto General Hospital · Toronto, ON
Interactive 3D visualization tools for congenital cardiac anatomy

- Sole developer of browser-based 3D viewers built with Three.js and ES6 JavaScript, rendering ~10 models of hearts that had undergone congenital heart surgery, used by medical students to study corrected anatomy
- Added per-chamber color coding and toggleable visibility with orbit and zoom controls, letting students hide outer chambers and examine internal structures at any angle
- Deployed through Google Firebase with CI after an initial AWS S3 static setup, and refined anatomical accuracy with feedback from the hospital's cardiac team

Education

BA, Digital Media (Computer Science & Game Design) **2021**
York University · Toronto, ON
